But unlike most ICS adopters he feels that ICS is definitely not for his desktop computer. Ante Florijancic isn't happy with his desktop computer, it's a Dell Latitude D630 laptop. According to Florijancic the desktop doesn't support any of the new ICS features, like 4 new UI features or the ability to do a "double-tap-to-zoom". "I started using ICS because I really liked the new UI features, and I also liked the fact that ICS supported multitouch gestures on the desktop. But I started to feel a little bit unhappy about using ICS for my desktop," he says. "While I am using an Android phone or tablet, I can live without most of the new UI features – including the new lock screen – and I can do the "double-tap-to-zoom" in almost any app." Florijancic knows that his problem isn't that all of the new ICS features are for touch screen devices, but the fact that only the touch screen devices have ICS. So why not go for ICS on a desktop computer as well? "But the problem with ICS on the desktop is that most of the new UI features do not have an equivalent on the desktop, including the new lock screen. So if you want to use the new lock screen on the desktop you need to use Windows Vista or Windows 7," Florijancic says. "I tried to install Windows 7 on the desktop computer – at first I got the Windows Vista interface and then I switched to Windows 7. But the problem is that if you install Windows 7 and then try to install an Android app, Windows 7 creates a shortcut for it in your start menu. So when you open the Android app it goes to the Windows 7 start menu, not to the Android start menu." "So you get two start menus – an Android one 82157476af
